ROBERTS D., Allen B., Araujo R., Aparicio A., Chung E., Davis K., Duncts D., Allen B., Araujo R., Kalman S., Kong C., Kurdi O., Duncan M., Federspiel N., Hyman R., Kalman S., Kong C., Kurdi O., Submitted (JAN-1997) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: Geranyl diphosphate + isopentenyl diphosphate = diphosphate + trans, trans-farnesyl diphosphate.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the FPP/GGPP synthetase family.
                                                                                                                                                                                                                                                                                                                01-AUG-1991 (Rel. 19, Last sequence update)
10-OCT-2003 (Rel. 42, Last annotation update)
Geranyltranstransferase (EC 2.5.1.10) (Farnesyl-diphosphate synthase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            STRAIN=K12;

Biol. 27:425-428(1995).
-!- FUNCTION: Catalyzes the trans-addition of the three molecules of IPP onto DWAPP to form geranylgeranyl pyrophosphate.
-!- CATALYTIC ACTIVITY: Dimethylallyl diphosphate + isopentenyl diphosphate = diphosphate + geranyl diphosphate.
-!- CATALYTIC ACTIVITY: Geranyl diphosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Badillo A., Steppuhn J., Dervere J., Camara B., Kuntz M.;

CATALYTIC ACTIVITY: Trans-farnesyl diphosphate.
diphosphate + isopentenyl diphosphate + isopentenyl diphosphate = diphosphate + geranylgeranyl diphosphate.
APTHANY: First committed step in carotenoid biosynthesis. Key enzyme in plant terpenoid biosynthesis. Key SUBUNIT: Monomer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5 KAYLTVCQERVERALDARLPAENILPQTLHQAMRYSVLNGGKRTRPLLTYATGQALGLPE

Nature 337:394-401(1997)
-!- CAPALYTIC ACTIVITY: Geranyl diphosphate + isopentenyl diphosphate
= diphosphate + trans.trans-farnesyl diphosphate.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Potential).
-!- SIMILARITY: Belongs to the PPP/GGPP synthetase family.
01-NOV-1997 (Rel. 35, Last sequence update)
10-OCT-2003 (Rel. 42, Last annotation update)
Probable geranyltranstransferase (EC 2.5.1.10) (Farnesyl-diphosphate
                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Usage by and for commercial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   216
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "Complete genomic sequence of nitrogen-fixing symbiotic bacterium Bradyrhizolum japonicum USDA110.";
DNA Res. 9:189-197(2002).
-!- CATALYTIC ACTIVITY: Geranyl diphosphate + isopentenyl diphosphate = diphosphate + trans.trans.transeyl diphosphate.
-! SUBCELLULAR LCCATION: Cytoplasmic [Potential]).
-!- SUBCELLULAR LCCATION: Cytoplasmic Potential).
-!- SIMILARITY: Belongs to the PPP/GGPP synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            42 KRVERALARLICAEDDCETELMAAMRYATLHGGKRTRALLCLAAGALADTPAHMLDDVGA

-!- CATALYTIC ACTIVITY: Geranyl diphosphate + isopentemyl diphosphate = diphosphate LOCATION: Cytoplasmic.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the FPF/GGPP synthetase family.
                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -I- CATALYTIC ACTIVITY: Trans-trans-farnesyl diphosphate + diphosphate = diphosphate + geranylgaranyl diphosphate.
-I- PATHWAY: Carotenoid and chlorophyll biosynthesis.
-I- SIMILARITY: Belongs to the PPP/GGPP synthetase family.
                                                                                                                                                                                      Plant Mol. Biol. Rep. 13:327-332(1995).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- CATALYTIC ACTIVITY: Trans-trans-farnesyl diphosphate + isopentenyl diphosphate = diphosphate + geranylgeranyl diphosphate.
-!- PATEWAY: Carotenoid and chlorophyll biosynthesis.
-!- SIMILARITY: Belongs to the FPP/GGPP synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       26.4%; Score 399; DB 1; Length 289;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 5908, Application US/09543681A
Patent No. 6605709
GENERAL INFORMATION:
APPLICANT: GARY BRETON
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABIL
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 2709-1002-001
CURRENT APPLICATION NUMBER: US/09/543,681A
CURRENT APPLICATION NUMBER: US/09/543,681A
PRIOR PRILING DATE: 1999-04-05
NUMBER OF SEQ ID NOS: 8344
SEQ ID NO 5908

Sequence 14, Application US/09187050B
Patent No. 6043072
Patent No. 6043072
GENERAL INFORMATION,
APPLICANT: Croteau, Rodney B
APPLICANT: Hefner, Jerry
TITLE OF INVENTION: Wacleic Acids Encoding Taxus Geranylgeranyl Diphosphate
TITLE OF INVENTION: Synthase, And Methods of Use
FILE REFERENCE: WSUR12423
CURRENT APPLICATION UNDERS: US/09/187,050B
CURRENT PILLIG DATE: 1998-11-05
NUMBER OF SEQ ID NOS: 34
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 14
LENGTH: 393

کر: تا Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon substrates.

Claim 35; Page 125-126; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule conciding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by

using microorganism having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Methylmonas is des go. geranyltransferase or farnesyl diphosphate synthetese [16ph], enzyme used in the invention. (Updated on 97-AUG-2003 to correct 05 field.)

New high growth methanotrophic bacterial strain, useful for producing

```
The invention relates to a high growth methanotrophic bacterial strain, which grows on a CI carbon substrate e.g. methane and methanol, and comportises a functional Embdenn Meyerhof carbon flux pathway comprising a gene coding a pyrophosphate dependent phosphofrutoxinase enzyme or a 165 RNA. The bacterial strain is useful for the production of single cell protein and for the biotransformation of a nitrogen-containing compound, or a mamonia, nitrate, nitrite or nitrogen. It is also useful for the production of a feed product comprising a protein, carbohydrates and a pigment and for reducing oxygen demand, for removing nitrates and intrites in methane-containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are present; The bacterial strain of the invention can be used as a carbon oxide with methane or methanol as a carbon source. It is also used in the production of biomass including proteins, carbohydrates and a wide production of biomass including proteins, carbohydrates and a wide compounds, useful as pigments and as monomers in polymeric materials and compounds, useful as pigments and as monomers in polymeric materials and in production of terpenoid and carotemoid compounds, useful as pigments and as monomers in polymeric materials and in production of expoplysaccharides at high levels. Sequences ABG61551-ABG61590 represent high growth methanotrophic bacrerial strain proteins of the invention. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                පි
                                                                                                                                                                                                                                                                                                                                                                                 isopremoid biosynthetic enzyme isolated from Methylomonas 16a. The invention is useful for obtaining a nucleic acid molecule encoding an invention is useful for obtaining a nucleic acid molecule encoding an observation compound biosynthetic enzyme, and for the microbial production of isopremoid compounds. The molecules of the invention are also useful for regulating isopremoid biosynthesis in an organism and for producting nucleic acid is also useful for feed additive, for the producting keratemoids and their derivatives, isopremoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present amino encid sequence represents the Methylomonas 16a open reading frame 7 (OR??) ispA (geranyltranferase or farmersyl diphosphate synthase enzyme) protein of the invention, as described above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Bscherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella preumoniae, Berughonnas and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the express these proteins, and to obtain antibodies capable of binding to the express these proteins. The proteins continued and sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed appecification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    62 PQRADAAACAVELIHAYSLVHDDLPAMDDDDLRRGQPTTHRAFDBATAILAADGLQALAF 121

The invention relates to an isolated mucies and compitating any one of the 6113 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid modelic acid a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway in which a proliferation or that inhibits cellular proliferation of the gene product or that has an activity against a biological pathway in which a proliferation required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or gene on which the test compound that inhibits proliferation of an organism. The antisense nucleic acids required for which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits acids acids and strains; or (13) identifying the target of a compound that inhibits acids required for proliferation in cells other than S. aureus, S. typhimurium, X. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target profaration in cells other than S. aureus, S. typhimurium, a pattent did not form the directly fram NIPO at the sequence of a contraction of an electronic format directly fram NIPO at the sequence of the privated pot the privated pot the privated pot the privated pot the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promerer operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense
                                                                                      63
                                                                                                               19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    design.

the invertion trainers to an isolated muctate acid compilating any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid enoding a polypeptide whose expression is inhibited by the antisense comprising a promoter operably linked to the nucleic acid (2) a host cell containing the vector; (3) an isolated conflicted by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular or proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation of the paper product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity, (11) a culture comprising strains in which the gene or value activity, (11) a culture comprising strains in which the gene compound's activity, (11) a culture comprising strains in which the gene conflicteration of an organism. The antisense nucleic acids required for proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids for redining a required for proliferation and the present seminates and serior of a cempound is energied by propiement or parameters and the serior of the required for proliferation and the present seminates and the proper serior or parameters and the serior of the required for proliferation of an organism. The artisens and the serior of the serior of the serior of the serior of the serior of the serior 
                                                                                                                                                                                                                                                                                                                                                                                                 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid comprising any one of

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            99
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4 LKAYLIVCQERVERALDARLPARNILPQTIHQAMRYSVLNGGKRTRPLLTYATGQALGLP

The invention relates to an isolated nucleic acid comprising any one of

The invention relates to an isolated nucleic acid comparising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that thinbits cellular proliferation; (7) identifying a compound that inhibits proliferation of an activity of a gene in an operon required for proliferation or that inhibits proliferation of an activity of a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overaxpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational days is scorening or screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimutium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in the procession of the strains of the target proliferation or the present seq

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

claim 25; SEQ ID NO 66105; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. N-PSDB; ACA25260.

Claim 25; SEQ ID NO 49314; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the foll antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid containing the vector; (3) an isolated on the largement whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or the activity of a gene in an operor required by the proliferation or the activity of a gene in an operor required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; or that inhibits cellular proliferation, or that inhibits cellular proliferation of an ordanism acts; (9) manufacturing an antibiotic; (10) profiling a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity, (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity, (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation to solate candidate molecules for rational driving profired for proliferation in cells of homologous nucleic acids required for equilibrial for proliferation in cells of the strains of an organism of the training for the surface of a compound of a condition of a serving of the strains of the strain of the surface of the strain of the surface of th K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated nucleic acid comprising any one of the invention relates to an isolated nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid containing the vector; (3) an isolated contained by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the agene product or that has an activity against a biological pathway required for proliferation, or that the inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's adivity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a proliferation of an organism of an organism. The antisense nucleic acids required for cellular proliferation of an organism. The antisense nucleic acids are useful for intentive proliferation of an organism or screening for homologous nucleic acids required for accepting a proliferation of an organism or screening for homologous nucleic acids required for a cellular proliferation of an organism or screening for homologous nucleic acids required for a cellular proliferation of an organism or screening for homologous nucleic acids required for a cellular proliferation of an organism can enable manufacturing a captured or a cellular proliferation of an organism captured and an organism captured and an organism captured and an organism captured and an organism captured and an organism capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. preumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     47.1%; Score 711; DB 6; Length 299; 54.1%; Pred. ```
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, that use in the discovery of movel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas acuginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins continued in a mission of proteins used to screen compounds in rational drug discovery programmes. The autisense mucleic acid sequence is also useful to screen for homologous concentration proteins colored which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part directly from WIPO at
